API Navigation

19/11/2026 3:17 pm GMT

Access the Eyelit MES API via the UI.

1. Navigate to the **Integration Manager**.
2. Click the **Public API Documentation** button to display the **MESM API List**. From this list, you have easy access to the Swagger documentation for any endpoint version and method that is available.

MESM API List

The image below shows the MESM API List screen. The top of the screen provides various methods for finding and filtering endpoints and methods.

The columns on the right show the major versions and below those are their minor versions for each endpoint + method.

Find an Endpoint + Method

The methods of an endpoint will have a green tick to specify the latest version of that method.

You can access an endpoint and method by:

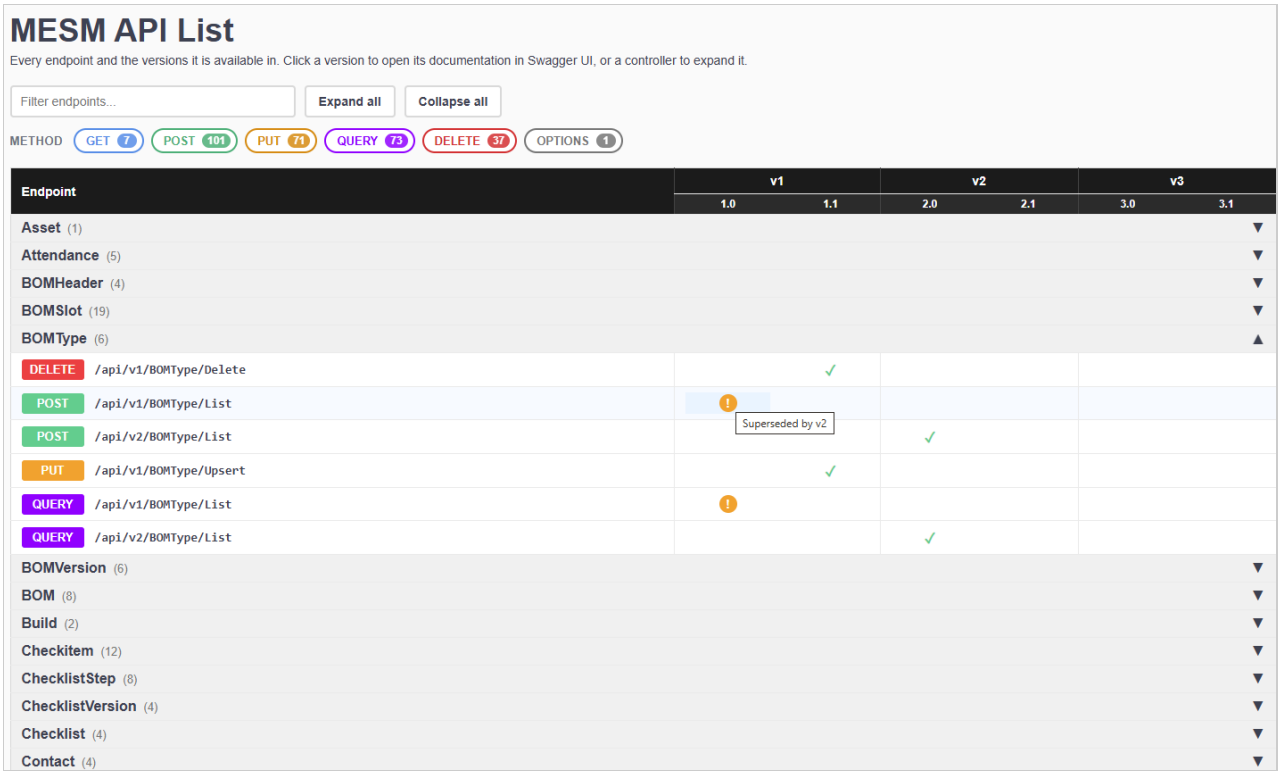

1. Searching for endpoints in the search field.
2. Selecting a method to get a filtered list of only those endpoints that support the method.
3. Finding the endpoint by browsing the Endpoint column and clicking it to expose the methods.

Symbols

With reference to the symbols in the image below:

✓ Click the green tick to access the latest version of the Swagger documentation for the endpoint + method.

All superseded versions of the endpoint + method is indicated with a yellow exclamation symbol. Click this symbol to access the specified version. The latest version will be displayed on another row with a green tick.

When clicking the green tick or yellow symbol, the Swagger documentation opens with the selected endpoint + method expanded. Eyelit follows semantic versioning (major.minor) at the API level. Authentication is required to make API calls.

Select the green button in the top right of the screen to return to the **MESM API List**.
